```
# arm_soc平台编译准备
```

1 概述

arm SoC平台,内部已经集成了相应的libsophon、sophon-opencv和sophon-ffmpeg运行库包,位于`/opt/sophon/`下。

通常在x86主机上交叉编译程序,使之能够在arm SoC平台运行。您需要在x86主机上使用SOPHON SDK搭建交叉编译环境,将程序所依赖的头文件和库文件打包至soc-sdk目录中。

2 编译环境准备

本章节需要提前准备libsophon-soc和sophon-mw包,请联系技术支持获取。

2.1 安装交叉编译工具链

```
```bash
sudo apt-get install gcc-aarch64-linux-gnu g++-aarch64-linux-gnu
```
```

2.2 准备libsophon

```
```bash
创建依赖文件的根目录
mkdir -p soc-sdk
解压sophon-img release包里的libsophon_soc_${x.y.z}_aarch64.tar.gz, 其中x.y.z为版本号
tar -zxf libsophon_soc_${x.y.z}_aarch64.tar.gz
将相关的库目录和头文件目录拷贝到依赖文件根目录下
cp -rf libsophon_soc_${x.y.z}_aarch64/opt/sophon/libsophon-${x.y.z}/lib ${soc-sdk}
cp -rf libsophon_soc_${x.y.z}_aarch64/opt/sophon/libsophon-${x.y.z}/include ${soc-sdk}
```

### ### 2.3 准备ffmpeg和opencv

```
```bash
# 解压sophon-mw包里的sophon-mw-soc_${x.y.z}_aarch64.tar.gz, 其中x.y.z为版本号
tar -zxf sophon-mw-soc_${x.y.z}_aarch64.tar.gz
# 将ffmpeg和opencv的库目录和头文件目录拷贝到依赖文件根目录下
cp -rf sophon-mw-soc_${x.y.z}_aarch64/opt/sophon/sophon-ffmpeg_${x.y.z}/lib ${soc-sdk}
cp -rf sophon-mw-soc_${x.y.z}_aarch64/opt/sophon/sophon-ffmpeg_${x.y.z}/include ${soc-sdk}
cp -rf sophon-mw-soc_${x.y.z}_aarch64/opt/sophon/sophon-opencv_${x.y.z}/lib ${soc-sdk}
cp -rf sophon-mw-soc_${x.y.z}_aarch64/opt/sophon/sophon-opencv_${x.y.z}/include ${soc-sdk}
```

2.4 准备第三方库

依赖libeigen3-dev、libgflags-dev、libgoogle-glog-dev、libexiv2-dev

2.4.1 准备和构建qemu虚拟环境

进入qemu 后,安装libeigen3-dev、libgflags-dev、libgoogle-glog-dev、libexiv2-dev

File: /home/yyf/Downloads/sophon/Re...230802/docs/docs zh/arm sochange 2 of 2

```
apt-get install -y software-properties-common
apt-add-repository universe
apt-get update
apt-get install -y libeigen3-dev libgflags-dev libgoogle-glog-dev libexiv2-dev
# 使用exit命令,退出qemu虚拟环境
exit
#### 2.4.2 拷贝第三方库的头文件和库
```bash
退出qemu虚拟环境后
libgoogle-glog-dev
cp -rf ${rootfs}/usr/lib/aarch64-linux-gnu/libglog* ${soc-sdk}/lib
cp -rf ${rootfs}/usr/include/glog ${soc-sdk}/include
libgflags-dev
cp -rf ${rootfs}/usr/lib/aarch64-linux-gnu/libgflags* ${soc-sdk}/lib
cp -rf ${rootfs}/usr/include/gflags ${soc-sdk}/include
libexiv2-dev
cp -rf ${rootfs}/usr/lib/aarch64-linux-gnu/libexiv2* ${soc-sdk}/lib
cp -rf ${rootfs}/usr/include/exiv2 ${soc-sdk}/include
libeigen3-dev
```

cp -rf \${rootfs}/usr/include/eigen3 \${soc-sdk}/include

> 这里,交叉编译环境和相关依赖环境的准备步骤已经准备完成,接下来可以编译需要在SoC平台上运行的程序。
